### K2M Unveils New Spinal System for Complex Spine Cases

July 5, 2007

K2M Inc has launched a comprehensive system that combines the newest versions of the Mesa and Denali Spinal Systems and includes new instruments designed to enhance the surgeon's ability to address complex spinal pathologies such as scoliosis.

The company's new Range Spinal System was designed as a combination of the best features of both systems. The result is a comprehensive system that addresses complex disorders including deformity, trauma, tumor, and complex degenerative diseases by combining best in class solutions and methodologies.

The Range Spinal System is an innovative system designed to provide surgeons with the ability to make an array of inter-operative decisions for spinal correction based on both the patient's pathology and the innovative instruments and implants the system offers.

The new system includes the next generation low profile Mesa locking technology, as well as the comprehensive Denali set screw based system that enables surgeons to address both upper and lower back surgeries.

More information can be found on the company's [Web site](#).
